October 1, 2026

Introduction

The client for the proposed project is the Office of the Municipal Administrator of the Municipality of Santa Maria, Bulacan. The office handles a wide range of administrative records and communications that pass through the municipal government, including incoming requests, travel and venue requests, vehicle and food requests, overtime requests, executive orders, contracts and agreements, Sangguniang Bayan endorsements, memorandum orders, certifications and permits, legal advice, communications for national agencies, and endorsement letters and recommendations. The office also coordinates official meetings and events that may involve the Mayor, the Municipal Administrator, other personnel, and the use of municipal venues.

Based on the client's project brief, these activities require several connected steps: receiving and logging a request, checking the completeness of its requirements, preparing the necessary document, reviewing or approving the draft, transmitting the finished document, and keeping the final record for future reference. The proposed Cloud-Based Document Management System (DMS) is intended to bring these steps into one web-based platform so that records can be organized, tracked, searched, and archived more consistently.

The system will also include a centralized schedule for meetings and official functions. The schedule is intended to help authorized staff avoid conflicts in venue use and in the availability of key participants. Since the system is for internal municipal operations, access will be limited to authorized personnel and controlled through role-based permissions. The physical logbook will continue to be used in parallel during the initial implementation, while the web system provides a searchable digital record and audit history.

Problem Statement & Objectives

The Municipal Administrator's Office handles documents that move through several people and several stages before they can be completed and archived. When records depend heavily on paper files, physical logbooks, separate scanned copies, and manual follow-up, it becomes harder to see where a request currently is, who last acted on it, whether requirements are complete, and whether the processing target is already at risk. Searching old records can also take longer when information is not stored in one searchable system. The same problem can occur in meeting and venue scheduling when schedules are checked separately instead of through one shared calendar.

The proposed DMS addresses these problems by creating a centralized record of the document lifecycle. Each request will have a unique control number and a status that changes as it moves from reception to screening, preparation, review or approval, transmission, and archiving. The system will also retain an audit trail of actions taken by authorized personnel. For transactions classified by the office as simple transactions, the system will support monitoring of the three-working-day processing period required under Republic Act No. 11032 and the applicable Citizen's Charter. The scheduling module will provide a single place for checking municipal venue and participant conflicts.

With these needs in mind, the project aims to accomplish the following objectives:

1. Develop a web-based document management system that organizes the receiving, screening, preparation, review, transmission, completion, and archiving of official records handled by the Municipal Administrator's Office.
2. Provide unique control numbers and real-time status tracking so authorized users can identify the current stage and responsible personnel for each request or document.
3. Provide a searchable digital archive that supports retrieval by control number, title, category, status, date, requesting party, or origin office, with permitted file preview and download.
4. Support role-based access for the Municipal Administrator, Executive Assistant II, Officers, and Clerk/Encoder personnel so that each user can access only the functions appropriate to the assigned role.
5. Maintain audit records of important actions, decisions, transmissions, and schedule changes to improve accountability and traceability.
6. Support monitoring of applicable processing deadlines and provide in-app alerts for items that are approaching or have passed their target date.
7. Provide monthly and annual summary reports for the document categories handled by the office.
8. Provide a centralized meeting and event calendar with venue conflict checking, attendee tagging, and in-app reminders for authorized users.
9. Provide secure authentication, controlled sessions, file integrity checking, daily backups, and privacy-aware access to municipal records.

UN SDGs Addressed

The proposed project primarily supports United Nations Sustainable Development Goal 9: Industry, Innovation and Infrastructure, which calls for resilient infrastructure and the promotion of innovation. The project does not claim to address every target under SDG 9. Its connection to the goal is more specific: it introduces a structured digital information system into an existing municipal administrative process and improves the office's ability to manage records and schedules through information and communication technology.

By replacing scattered tracking activities with a centralized web system, the project supports the modernization of internal public-sector processes. Features such as searchable digital records, role-based access, audit trails, deadline monitoring, and centralized scheduling can make the office's information infrastructure more organized and dependable. In this sense, the project contributes to the use of technology and innovation in local government operations while remaining focused on the actual needs identified by the client.

Scope of the Project

The project will develop an internal, cloud-based Document Management System for the Municipal Administrator's Office of the Municipality of Santa Maria, Bulacan. The system will cover the six-step document lifecycle defined by the client: document reception, initial screening, document preparation, review and approval, transmission and notification, and completion and archiving. It will also include search and retrieval, dashboards and reports, audit trails, user and role management, in-app notifications, and a centralized meeting and event scheduling module.

In Scope

- Authentication and controlled staff account provisioning through Keycloak using OpenID Connect (OIDC), with application-side user profiles and role assignments synchronized for authorized municipal personnel.
- Role-based access control for the Municipal Administrator, Executive Assistant II, Officer, and Clerk/Encoder functions identified in the client brief.
- Document reception and intake, including request encoding, unique control-number assignment, multi-file upload, and applicable processing-deadline computation.
- Initial screening of completeness, return-for-compliance handling, and resubmission of missing or corrected files.
- Document preparation, assignment to an officer, upload of draft versions, use of standard document templates, and submission for review.
- Review and approval actions including approve, endorse, or deny; denial requires written grounds, and the system records whether a Mayor signature event is required.
- Transmission records containing the recipient, receiving office, method, date and time, and proof of transmission. Multiple transmissions may be recorded when required.
- Completion and archiving, including upload of the final signed copy, closing of completed records, and permanent read-only retrieval of closed records.
- Search and retrieval using metadata and full-text indexing, filters, inline PDF preview, and download subject to access permissions.
- Dashboards and monthly/annual summary reports for office workload, pending actions, closed transactions, and document categories.
- Append-only document and activity logs that record the actor, action, time, and relevant details of state-changing operations.
- Centralized meeting and event scheduling across the six venues identified by the client: Municipal Conference Room, Command Center Room, Social Hall, Gymnasium, Mayor's Conference Room, and Administrator's Office.
- In-app notifications for review submissions, decisions, schedule reminders or changes, and processing items that are at risk or overdue.
- Browser-based access, with the primary interface intended for desktop Windows workstations and mobile-browser support focused on schedule viewing.
- Course-required use of HTML, CSS, JavaScript, and XML. Frontend-to-backend communication will use a GraphQL API, while the required XML component will be fulfilled via XML Schema (XSD) for document data validation and export, to be finalized during implementation.

Out of Scope / Limitations

- Public or citizen self-registration and a citizen-facing online submission portal. Requesting parties are recorded as data, but they are not application users in this release.

- Email and SMS notification delivery. Notifications are limited to the in-app notification center in the current release.
- Replacement of the physical logbook. The system is designed to operate in parallel with the office's physical logbook during implementation.
- Cryptographic or PKI-based digital signatures. The system records signature events and signed files, but it does not create a legal electronic signature.
- Direct scanner hardware integration. Documents are scanned outside the system and uploaded as files.
- Integration with external LGU systems, Sangguniang Bayan systems, Mayor's Office systems, or national agency portals.
- Bulk digitization of the historical paper archive that existed before system implementation.
- Native Android or iOS applications. Mobile support is browser-based and limited primarily to schedule viewing.
- High-availability or multi-node deployment. The current design uses a single virtual machine for the application server and relational database.
- Recurring-event rules, RSVP tracking, external attendees, and venue-capacity management in the scheduling module.

User Roles

Role / Actor	Main Responsibilities
Municipal Administrator (Approver)	Full access to the system; reviews, approves, endorses, or denies requests; manages users, reports, and settings according to granted permissions.
Executive Assistant II (Approver)	Reviews and acts on requests, accesses dashboards and reports, and assists with document approval and endorsement.
Officer	Prepares and uploads draft documents, handles assigned work, and contributes information used in reports.
Clerk / Encoder	Receives and logs requests, scans/uploads files, assigns control numbers, checks completeness, handles tagging, transmission, archiving, selected simple document preparation, and venue scheduling.

The Mayor and external requesting parties are not treated as standard application user roles. The Mayor may appear as a required signatory or tagged participant, while requesting parties are stored as record data.

Technology and Deployment

Component	Planned Use
Front end	HTML5, CSS3, and JavaScript for the responsive web interface and client-side interaction.
XML requirement	An XML component is required by the course. Primary API communication will use GraphQL, while the XML requirement will be satisfied through XML Schema (XSD) validation for uploaded document records or data exports during implementation.
Authentication and sessions	Keycloak using OpenID Connect (OIDC). Passwords are handled by the identity provider and are not stored in the application database.
Application hosting	A single virtual machine hosts the application server and relational database for the current release.
Database	Relational database for users, roles, records, workflow state, schedules, notifications, logs, and other application data.

Component	Planned Use
File storage	Backblaze B2 object storage for uploaded files, with file metadata and references maintained by the application.
Search	Metadata filtering and a full-text/inverted index for document search.
Supported office files	PDF, DOCX, and XLSX uploads as defined in the final requirements; printable forms and PDF preview are supported where permitted.

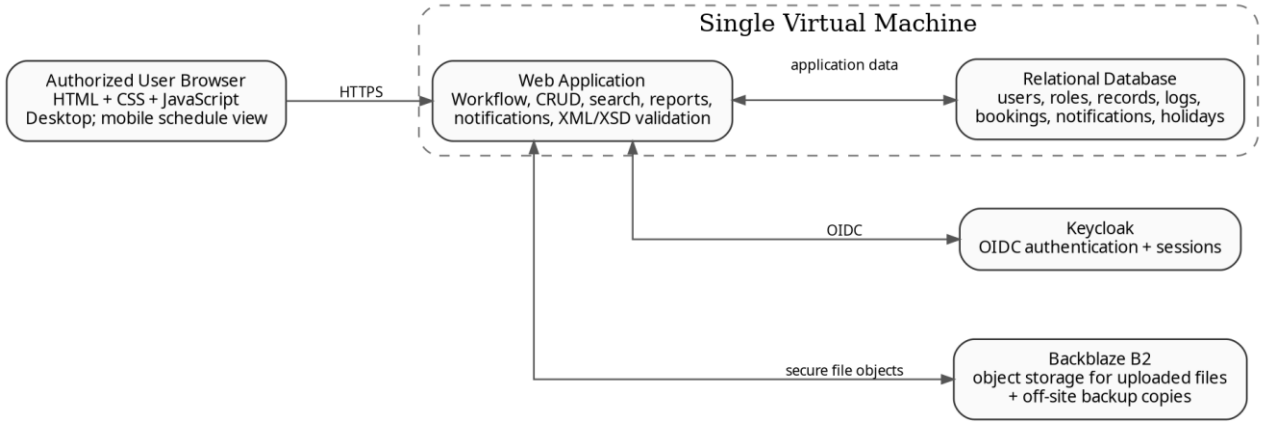

Figure 1. Proposed technical architecture of the web system.

CRUD and Session Requirement

The course requires sessions and CRUD operations. Sessions will be controlled by Keycloak policies and propagated to the application through OIDC. Create, read, and update operations are present throughout intake, document preparation, scheduling, user administration, and reporting. Delete behavior is deliberately restricted for official records: referenced users are deactivated instead of hard-deleted, role assignments may be removed, events may be cancelled, and closed official records and audit logs remain preserved. This approach satisfies the system's administrative data-management needs without allowing users to erase records that are needed for accountability.

Planned Academic Deliverables and Course Milestones

Milestone	Deliverable
Week 9	Project proposal document and proposal video (maximum 15 minutes); client approval during the synchronous session on October 3.
Week 11	Hosted web system; web and database ZIP; final PDF documentation with website link, test results, and screenshots; signed client agreement.

Functional/ Non-functional Requirements

Functional Requirements

Requirement IDs	Area	Proposal Requirement Summary
FR-01 to FR-06	Authentication, Staff Accounts, and RBAC	Users authenticate through Keycloak (OIDC). The application keeps linked staff profiles, supports authorized role assignment/deassignment, account activation/deactivation, and server-side permission checking for every protected action.
FR-07 to FR-11	Document Reception	Clerk/Encoder users encode incoming requests, assign a unique sequential control number, upload permitted supporting files, compute the applicable processing target, and automatically create a reception log entry.
FR-12 to FR-15	Initial Screening	The Clerk/Encoder records whether required attachments and information are complete. Incomplete requests are returned for compliance with specific deficiencies; resubmissions return to screening, while passed requests advance to preparation.
FR-16 to FR-21	Document Preparation	Authorized Officers or Clerks create output documents, assign document categories and control numbers, upload versioned drafts, use the template library, identify the drafting officer, and submit drafts for review.
FR-22 to FR-25	Review and Approval	Only users with review permission can act on the review queue. Approvers may approve, endorse, or deny a document; denial requires written grounds. The decision-maker, timestamp, and any required Mayor signature event are recorded.
FR-26 to FR-28	Transmission	Clerks record each transmission with recipient, receiving office, received-by information, delivery method, date/time, and optional proof of transmission. A document may have more than one transmission record when needed.
FR-29 to FR-31	Completion and Archiving	Before closing, the final signed copy is uploaded when applicable. Approved, endorsed, denied, or transmitted records may be closed according to workflow rules. Closed records become read-only and remain retrievable.
FR-32 to FR-34	Search and Retrieval	Authorized users can search request/document metadata and indexed content, filter by type, category, status, date range, and origin office, preview PDFs inline, and download files allowed by their permissions.
FR-35 to FR-38	Dashboard and Reports	The dashboard shows totals, incoming requests, pending actions, closed transactions, and processing items at risk or overdue. Monthly and annual summaries are generated by document category and may be exported to PDF or Excel.
FR-39 to FR-40	Audit Trails	Each state-changing action writes an append-only audit entry with actor information, action, time, and details. Document and activity logs are viewable but are not editable or deletable through the interface.
FR-41 to FR-46	Scheduling	Authorized users can create, edit, and cancel meetings/events for the six municipal venues. The system prevents conflicting venue times and required-participant conflicts, tags system users as attendees, supports mobile schedule viewing, creates in-app reminders, and logs schedule changes.
FR-47 to FR-51	Notifications	The system creates in-app notifications for review submissions, decisions, schedule reminders/changes/cancellations, and processing items that are at risk or overdue. Users can view unread counts, mark items read, and open the related request, document, or event through a deep link.

Non-functional Requirements

Category	Requirement
Performance	Dashboard and queue pages should load within 3 seconds at the 95th percentile under normal office load; keyword search should return within 2 seconds over a corpus of up to 100,000 documents; the system should support at least 50 concurrent authenticated users. Frequently used keys and search fields are indexed.
Security	Authentication is delegated to Keycloak; traffic is protected with TLS; authorization is enforced on the server; uploaded files receive SHA-256 checksums; file downloads use short-lived access links; audit logs are append-only; session behavior follows the identity-provider policy.
Privacy	Access to personal information is role-scoped and the project must follow the Data Privacy Act of 2012 (Republic Act No. 10173) and an appropriate retention policy.
Reliability and Backup	The target is 99% availability during office hours for the single-VM design. Database backups run at least daily with off-site copies, with a recovery-point objective of up to 24 hours and a recovery-time objective of up to 4 hours.
File Integrity and Durability	Uploaded files are stored in Backblaze B2, with checksum data retained for integrity verification and backup/versioning used to reduce the risk of loss or corruption.
Usability	The main interface is designed for desktop Windows workstations at 1280-pixel width or higher. Mobile browser access is supported for schedule checking. Navigation and labels should remain clear to municipal staff who use the system as part of daily office work.
Compatibility	The system supports current and previous major versions of Chrome, Edge, and Firefox, and works with PDF, DOCX, and XLSX files used by the office.
Compliance and Time	The interface should follow the government web-template requirements identified in the technical specification. Timestamps are recorded and displayed consistently using Philippine Standard Time. Processing targets follow the applicable Citizen's Charter and RA 11032 classification rather than a generic 72-clock-hour rule.
Maintainability	Database changes use versioned migrations; permission strings are defined consistently; the holiday calendar is stored as data instead of hard-coded dates; and the document and booking modules remain separated while sharing platform services such as users, roles, and notifications.

Database design (ERD)

The database design is organized around two connected areas: the document-management workflow and the meeting/event scheduling workflow. The ERD shown in this proposal is a conceptual view based on the final requirements and the supplied schema/ERD materials. It focuses on the entities and relationships needed to explain the project clearly at proposal stage, while lower-level implementation details can be refined during coding without changing the intended workflow.

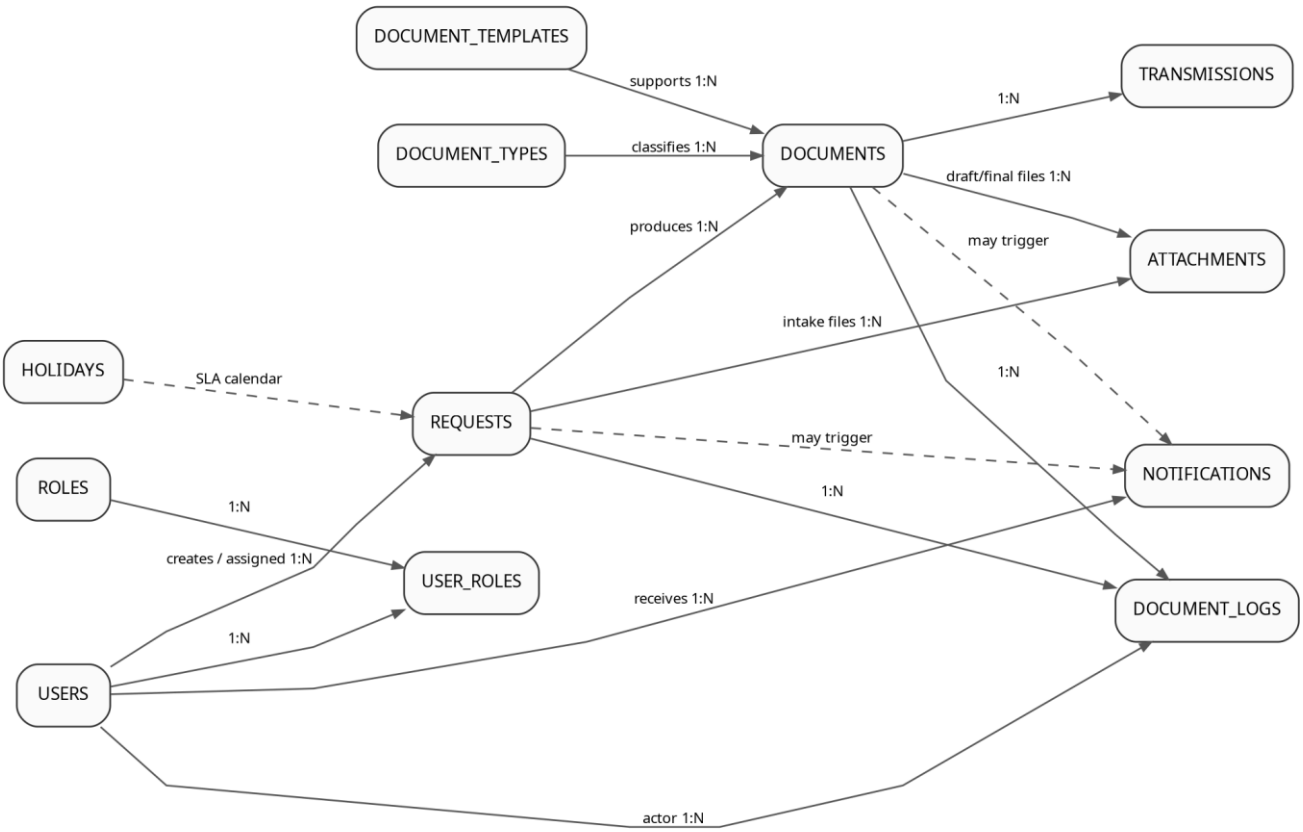

Figure 2. Conceptual ERD - document management, access control, files, logs, and notifications.

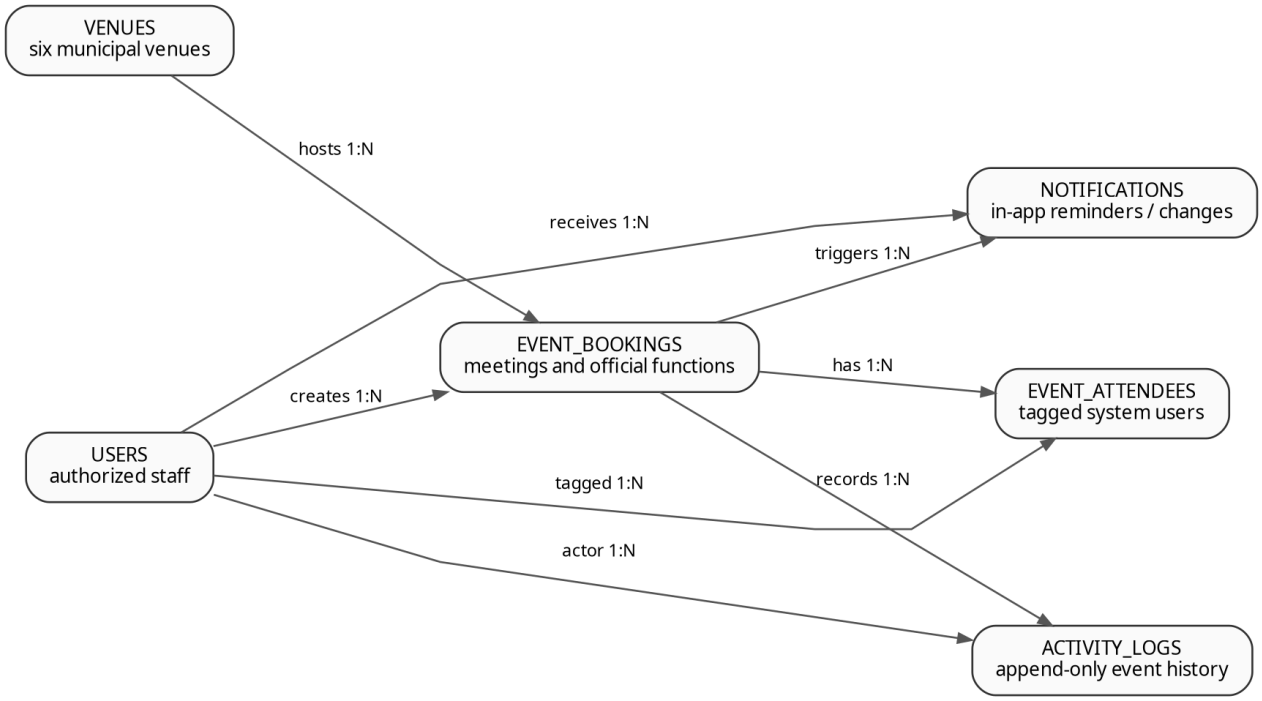

Figure 3. Conceptual ERD - venue and event scheduling module.

Main Database Entities

Entity	Purpose
Users	Authorized municipal personnel linked to the identity provider. The application stores the staff profile and account status, not the password.
Roles / User Roles	Role definitions and user-role assignments used to enforce role-based access.
Requests	Incoming requests or communications received by the office, including requesting party, origin office, status, dates, assignment, and processing target.
Documents	Output documents prepared from a request or created as a standalone issuance, such as executive orders, endorsements, certifications, permits, memoranda, legal opinions, and response letters.
Document Types	Classification and control-number prefix information for document categories.
Attachments	Uploaded scans, annexes, draft versions, signed final copies, and proofs associated with requests or documents.
Transmissions	One-to-many dispatch records showing when and how an approved or signed document was transmitted and to whom.
Document Logs	Append-only record of workflow actions and status changes for traceability.
Document Templates	Standard drafting templates organized by category.
Holidays	Calendar data used when computing working-day processing targets.
Venues	The six municipal venues covered by the centralized schedule.
Event Bookings	Meeting/event information including venue, date, start/end time, organizer, status, and Mayor/Administrator involvement flags.
Event Attendees	Associates authorized system users with meetings/events that require their attendance.
Activity Logs	Append-only history of scheduling and other relevant administrative actions.
Notifications	In-app alerts and reminders associated with requests, documents, events, or assigned responsibilities.

Relationship Summary

Relationship	Cardinality
A user may hold one or more roles; a role may be assigned to many users.	Many-to-many through User Roles
A user may create or be assigned to many requests.	One-to-many
A request may produce one or more output documents; the final requirements also allow selected standalone issuances.	One-to-many / optional parent request
A request or document may have several uploaded files.	One-to-many
A document may have multiple transmission records.	One-to-many
Requests/documents and events keep append-only histories tied to the acting user.	One-to-many
One venue may host many bookings over time, but each booking uses one venue.	One-to-many
An event may tag several system users, and a system user may attend many events.	Many-to-many through Event Attendees
Users may receive many notifications generated by workflow or scheduling events.	One-to-many

Features of the System

The proposed system is organized around the same workflow described by the client. The interface is not designed as a general public portal; it is an internal working system for authorized municipal personnel. The major features below correspond directly to the functions identified in the client brief, final requirements, and supplied wireframes.

Feature	Description
Login and Staff Registration / Account Provisioning	Authorized personnel sign in through Keycloak. To satisfy the course registration requirement while keeping the system internal, staff registration/account provisioning is limited to authorized municipal personnel instead of being open to the public. The application stores linked staff profiles and role assignments but does not store user passwords.
Executive Dashboard	Shows document workload, incoming requests, pending actions, closed transactions, processing items at risk or overdue, and quick access to operational modules.
Reception and Screening	Allows the Clerk/Encoder to log an incoming request, assign a control number, upload scanned requirements, check completeness, return incomplete submissions for compliance, and move complete items to preparation.
Document Preparation	Allows assigned staff to prepare output documents, use the standard template library, upload drafts, and submit work for review.
Review / Approval / Endorsement	Provides an approver queue for authorized reviewers. Decisions are recorded as approved, endorsed, or denied, with written denial grounds and decision timestamps.
Transmission Desk	Records the destination, recipient, method, date/time, and proof of transmission. Multiple dispatch records may be attached to the same document when needed.
Municipal Records Archive	Stores closed records as read-only references and provides search, filtering, PDF preview, and permitted downloads.
Venue and Event Calendar	Provides a shared calendar for the six client-identified venues, prevents conflicting reservations and required-participant double-booking, and supports attendee tagging and schedule reminders.
Reports and Compliance Monitoring	Provides workload indicators, monthly/annual summaries, deadline monitoring, and export to PDF or Excel.
Audit Trail	Displays append-only chronological logs showing who performed a state-changing action and when it occurred.
Notification Center	Shows in-app review, decision, schedule, and processing alerts with unread tracking and links to the affected record.
Document Dossier and Routing Slip	Provides a consolidated view of a record's metadata, files, current stage, action history, and routing information to help staff understand the record without checking several separate screens.

Sitemap

The sitemap below shows the planned organization of the system. After login, the user is taken to the dashboard. The modules visible from the dashboard depend on the permissions granted to the user's role.

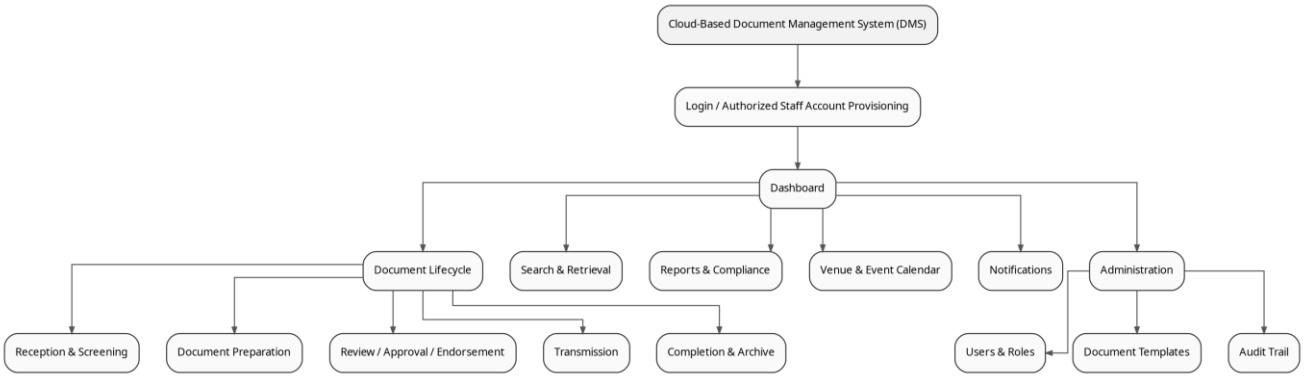

Figure 4. Proposed sitemap of the Cloud-Based Document Management System.

Sitemap Description

Page / Module	Purpose
Login / Staff Registration and Provisioning	Entry point for authenticated staff and controlled internal account registration/provisioning.
Dashboard	Summary page and main navigation point for operational work.
Document Lifecycle	Contains reception and screening, preparation, review/approval, transmission, and completion/archive stages.
Search & Retrieval	Searches active and archived records using metadata and full-text indexing.
Reports & Compliance	Shows operational summaries and applicable processing-deadline monitoring.
Venue & Event Calendar	Schedules meetings/functions and checks venue and participant conflicts.
Notifications	Shows unread and historical in-app alerts.
Administration	Contains users/roles, document templates, and audit-trail access according to permissions.

Wireframes

The wireframes are preliminary interface studies for the proposed system. The two first wireframes below supplement the team's existing set so the course requirement for login and registration/account provisioning is represented. The remaining wireframes are the design resources supplied by the group.

Some early team wireframes contain draft labels such as "72-hour SLA" and government/compliance branding. Those labels should not be treated as final legal or certification statements. During implementation, deadline wording will follow the final requirement of three working days for simple transactions under RA 11032 and the applicable Citizen's Charter, and any formal branding/compliance statement will be used only when it is actually applicable.

Login Page

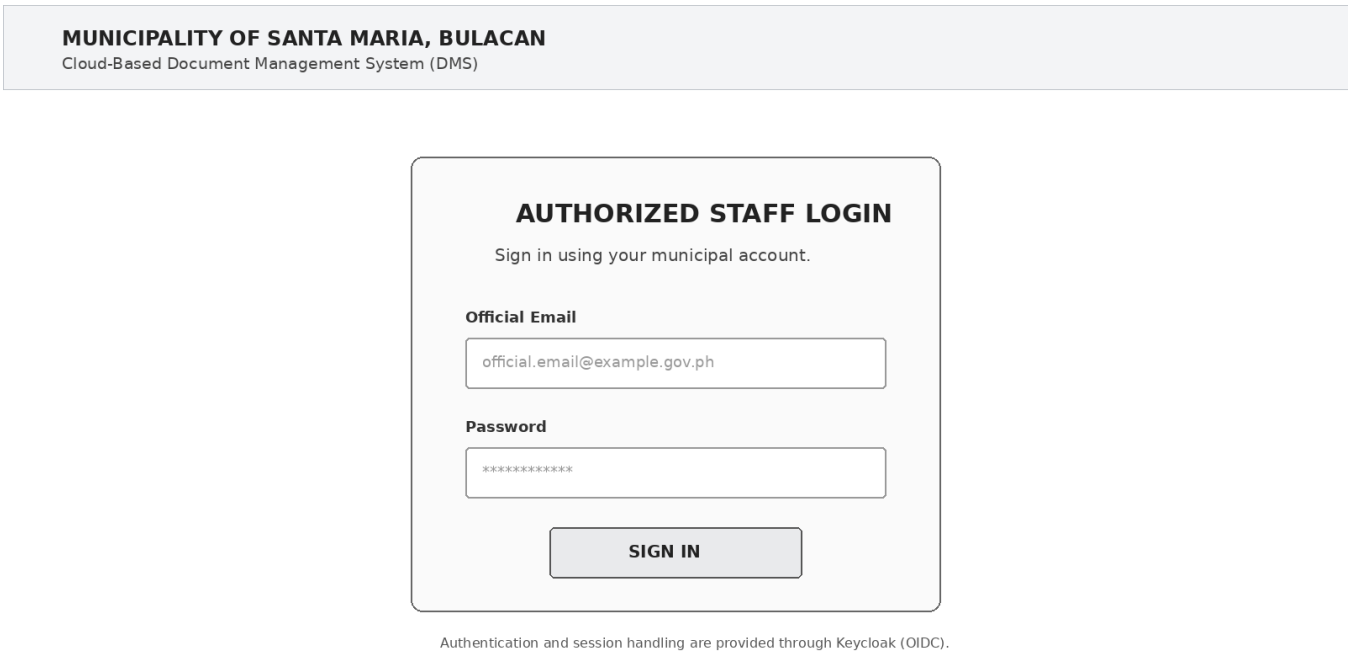

Figure 5. Login wireframe - authorized staff authentication through the municipal identity provider.

The login page provides the entry point for authorized personnel. Keycloak handles credentials and sessions so passwords are not stored in the application database.

Staff Registration / Account Provisioning

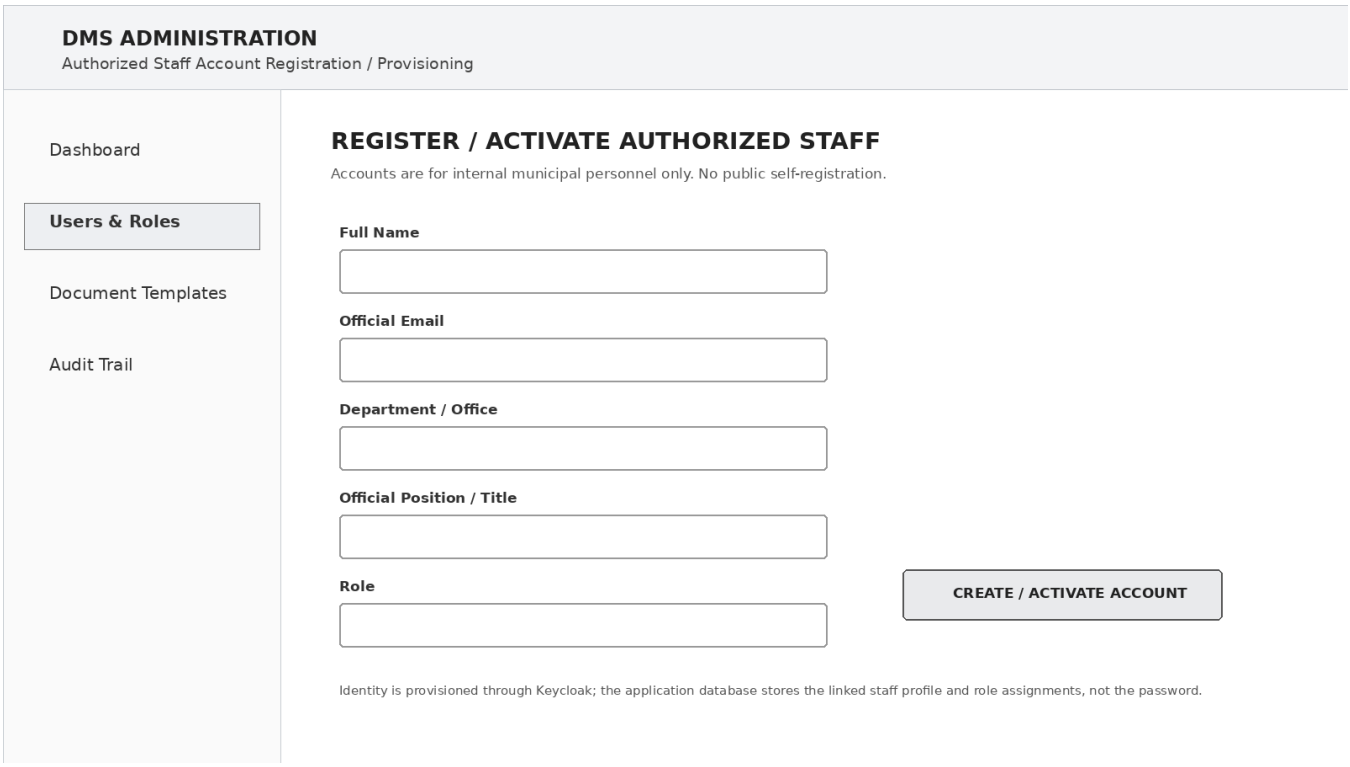

Figure 6. Staff registration/account provisioning wireframe - controlled internal account setup.

Because this is an internal municipal system, the registration requirement is implemented as controlled staff onboarding rather than a public sign-up page. Authorized personnel can be registered/provisioned through the identity platform and assigned the appropriate system role.

Executive Dashboard

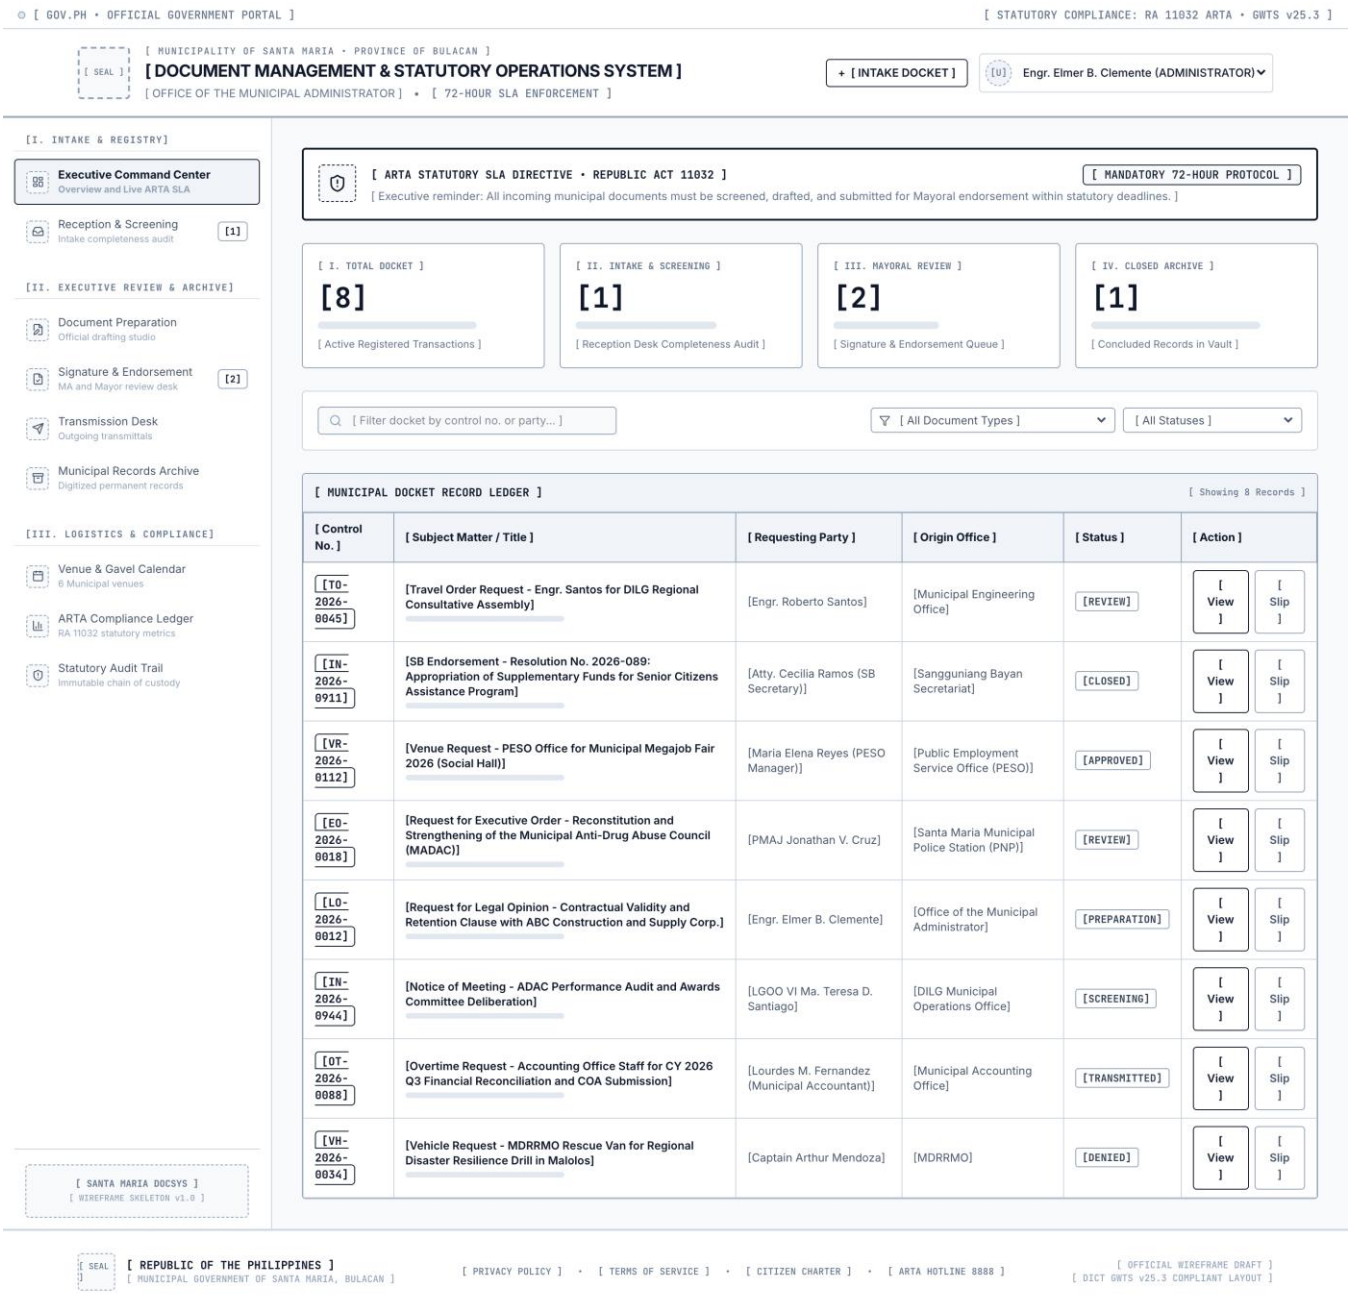

Figure 7. Executive dashboard wireframe.

The dashboard summarizes the current workload and gives users quick access to records that require attention.

Reception and Screening

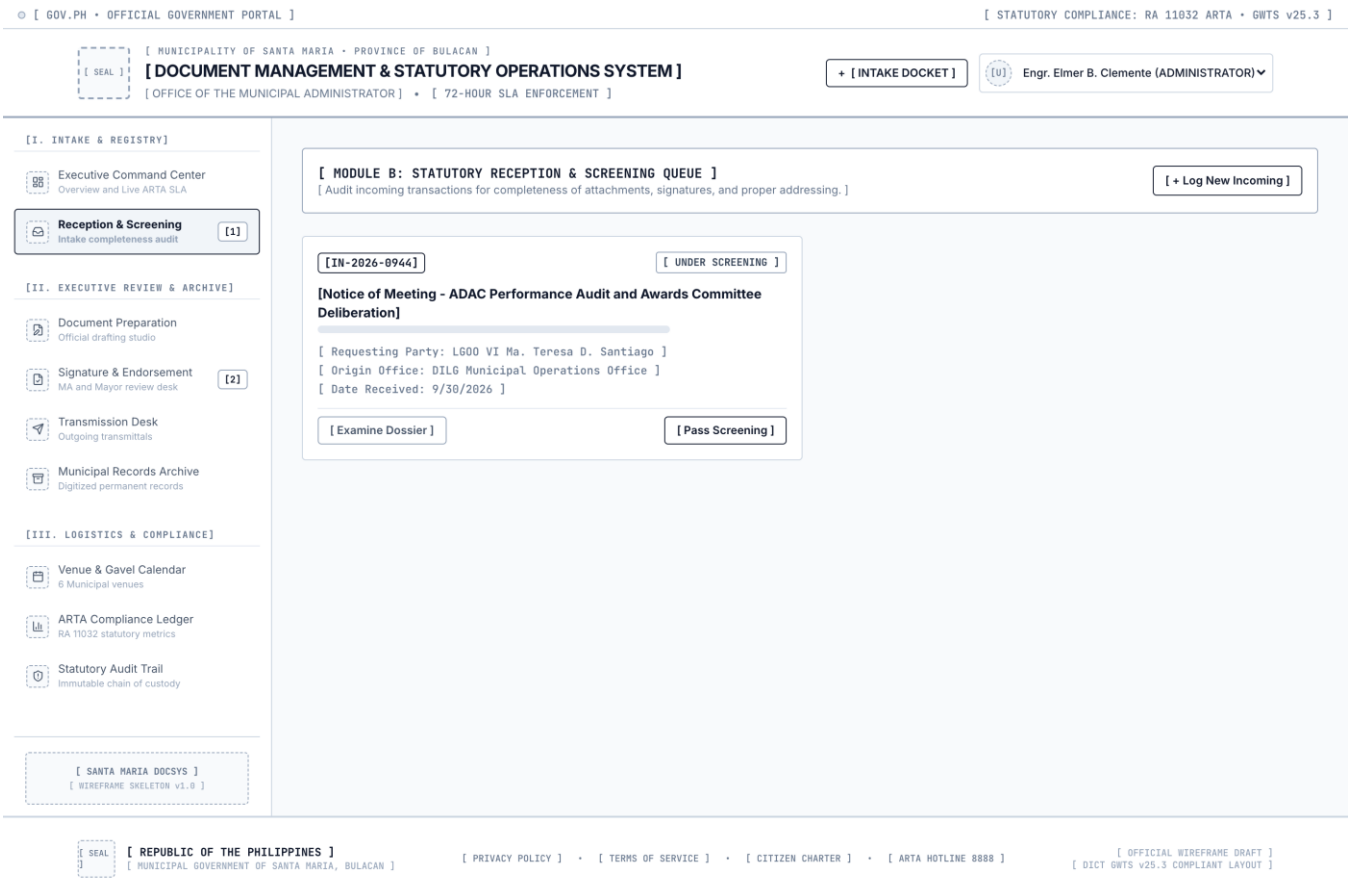

Figure 8. Reception and screening wireframe.

The reception module focuses on logging incoming requests, checking requirements, and moving complete items into the preparation stage.

Document Preparation

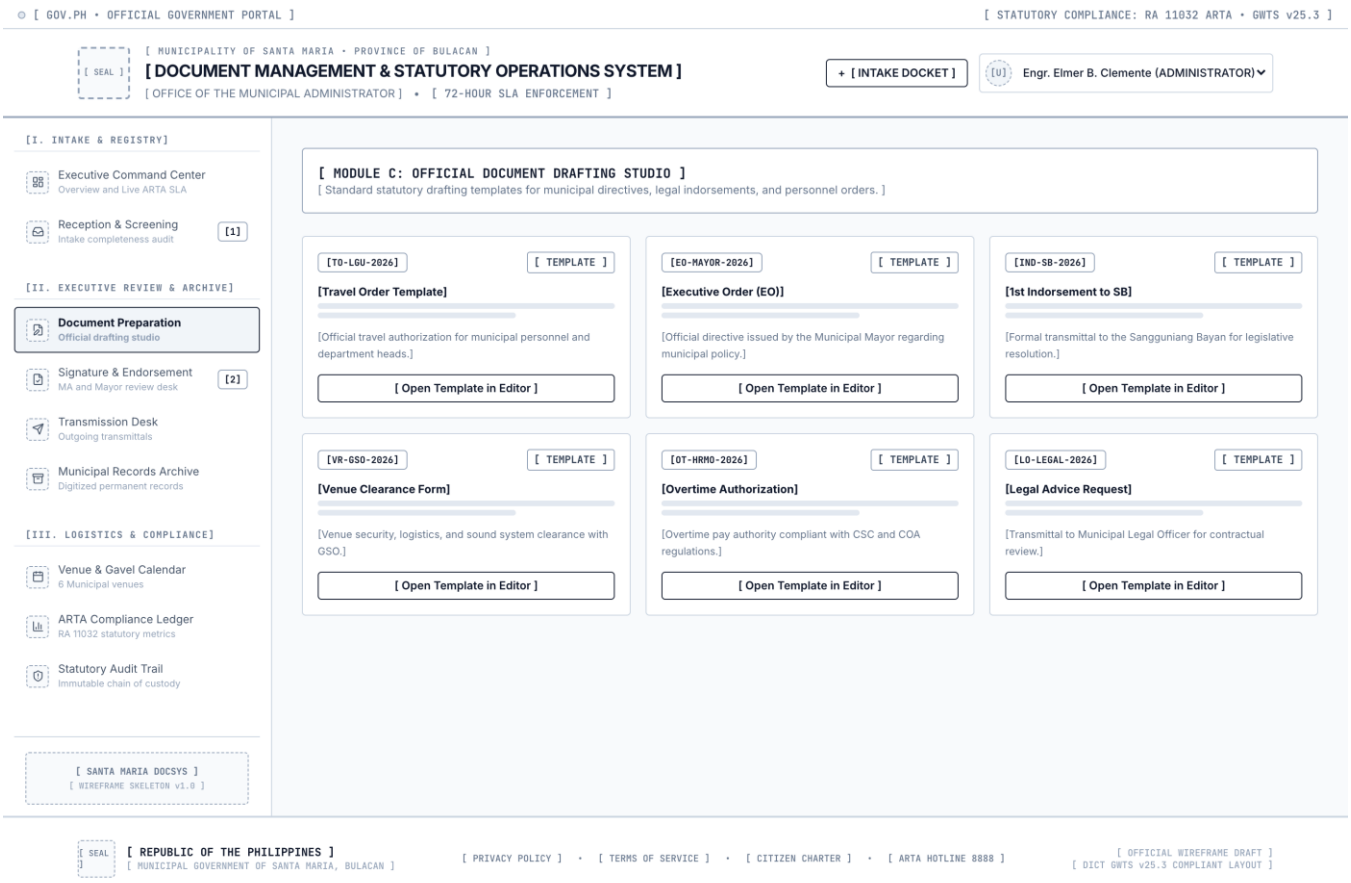

Figure 9. Document preparation wireframe.

The preparation module presents the drafting workload and access to standard document templates before submission for review.

Review and Endorsement

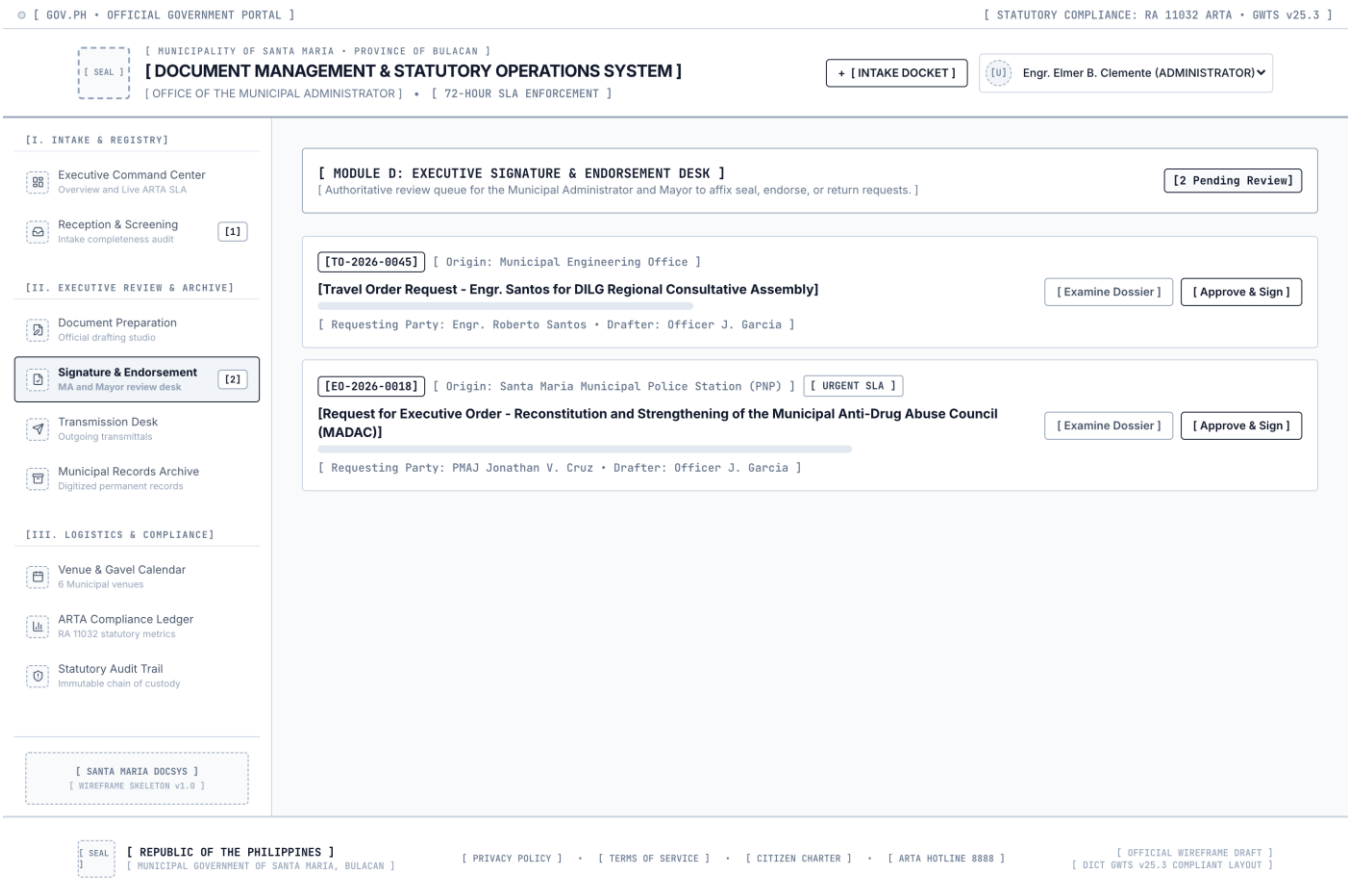

Figure 10. Review and endorsement wireframe.

Authorized approvers view documents awaiting action and record approval, endorsement, or denial decisions.

Transmission Desk

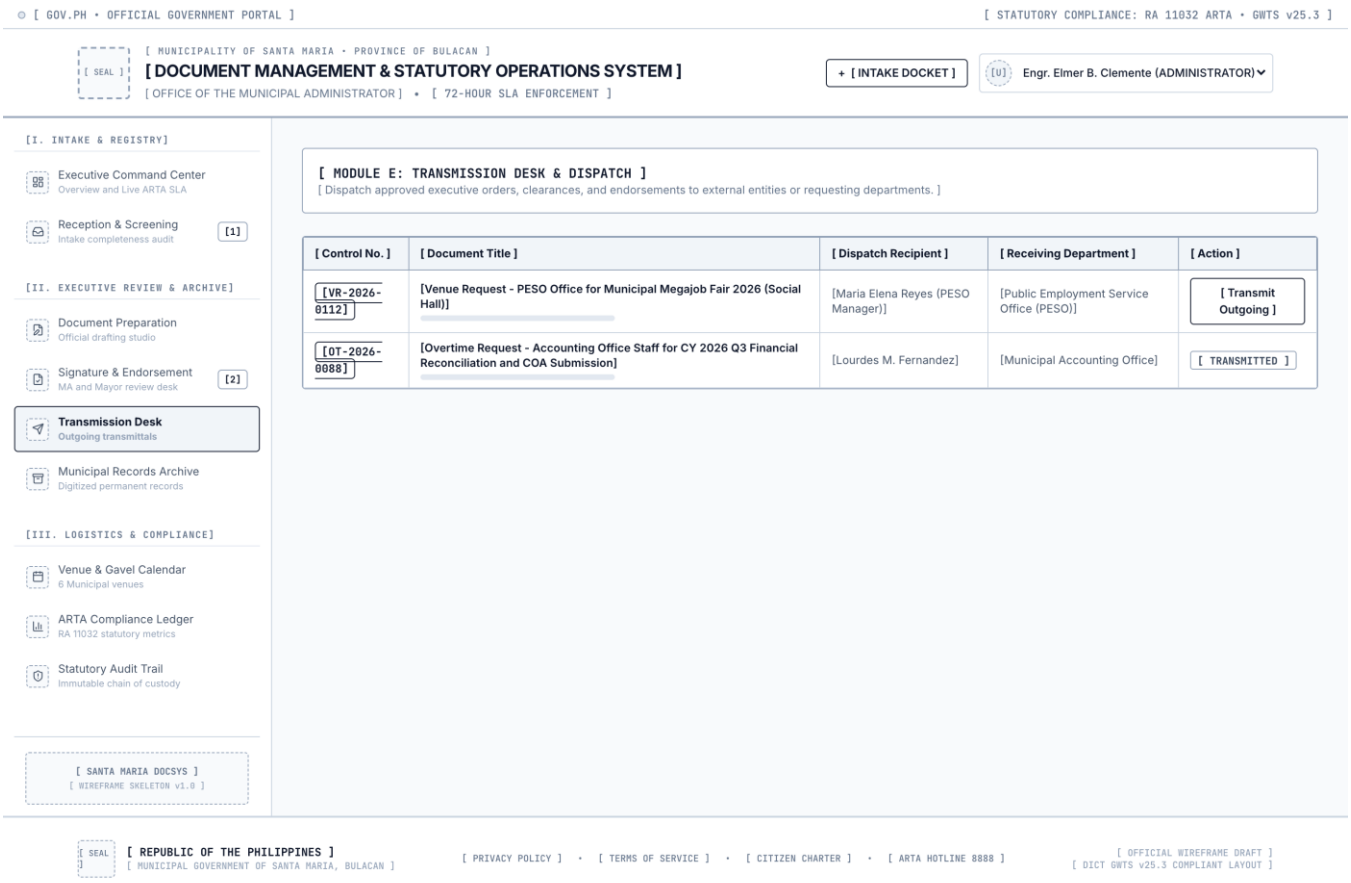

Figure 11. Transmission desk wireframe.

The transmission view records how completed documents are dispatched and preserves proof of receipt when available.

Municipal Records Archive

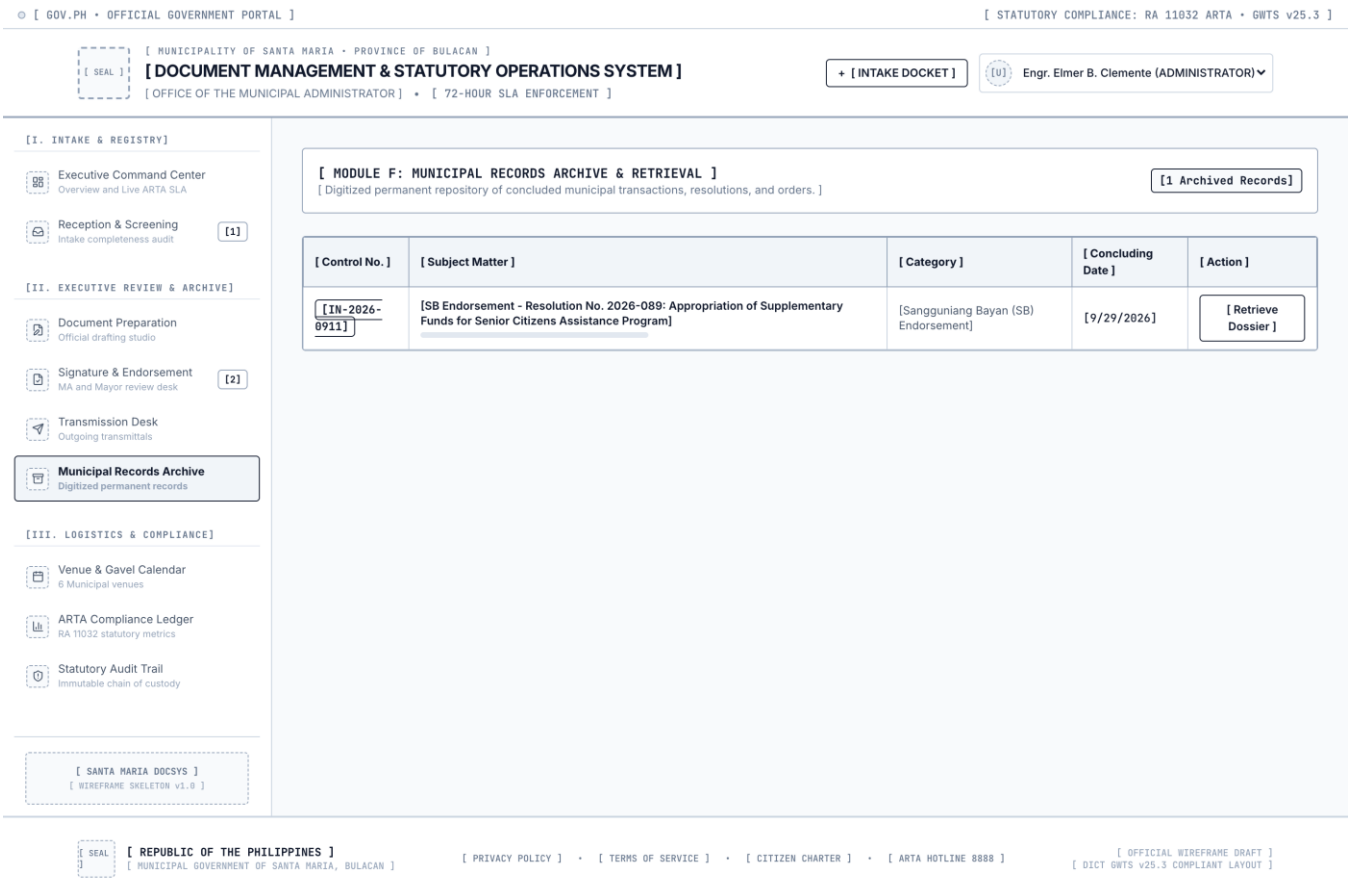

Figure 12. Municipal records archive wireframe.

The archive provides a searchable list of closed records for future reference and reporting.

Venue and Event Calendar

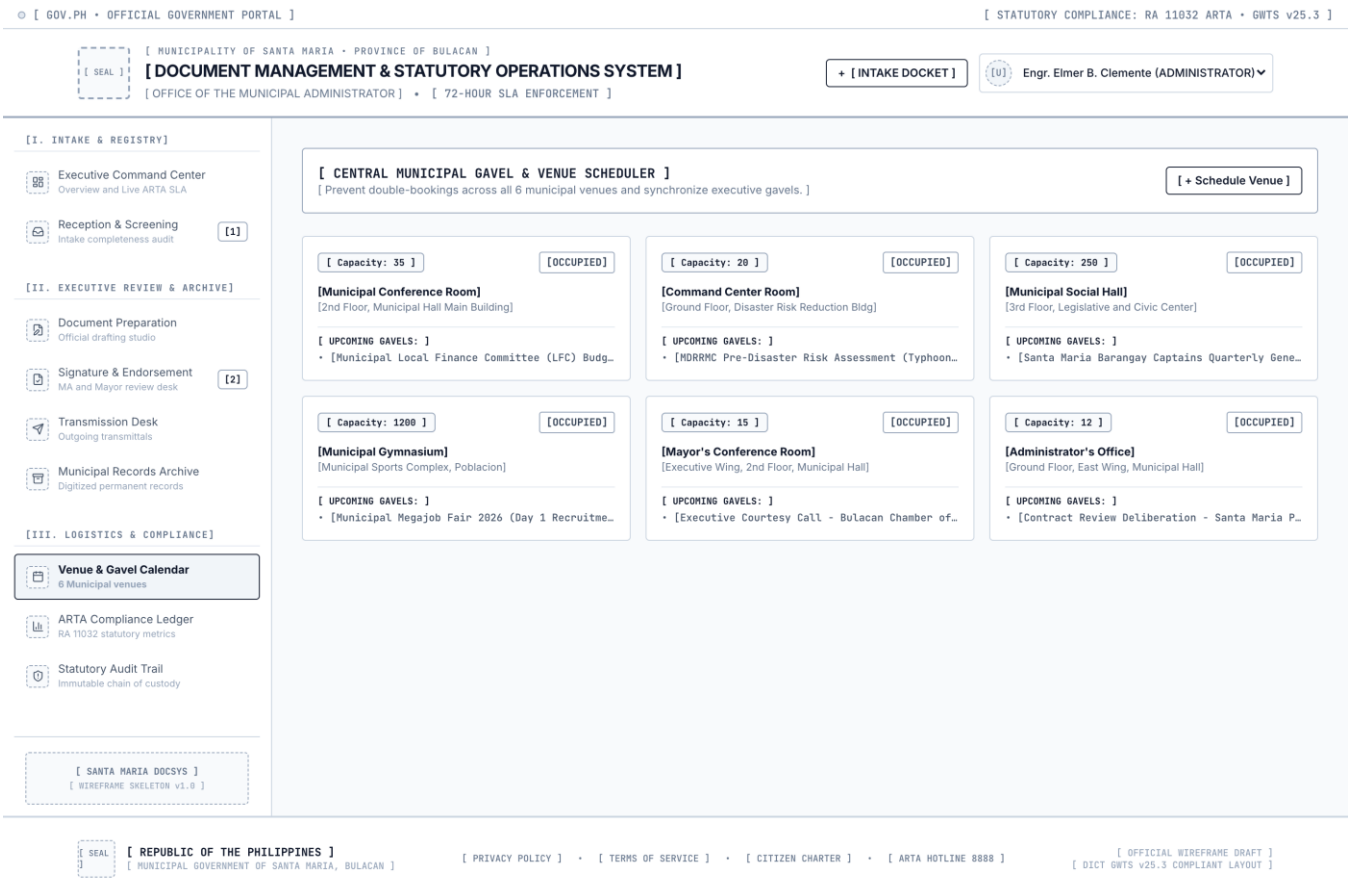

Figure 13. Venue and event calendar wireframe.

The schedule module shows planned meetings and official functions and supports conflict checking for venues and required participants.

Reports and Compliance

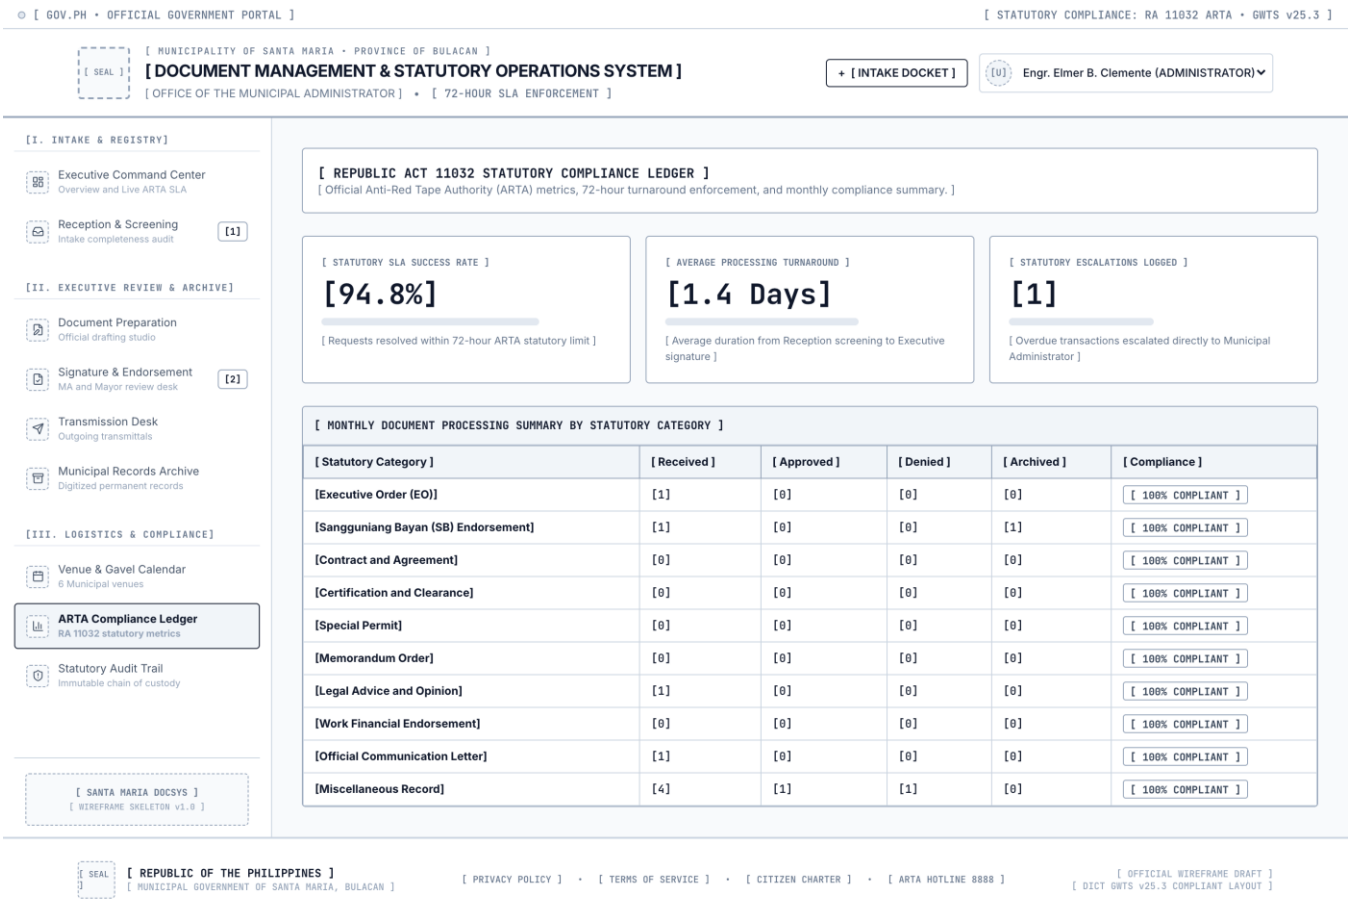

Figure 14. Reports and compliance wireframe.

The reporting view summarizes turnaround and document-category activity so the office can monitor workload and applicable processing targets.

Statutory Audit Trail / Administration

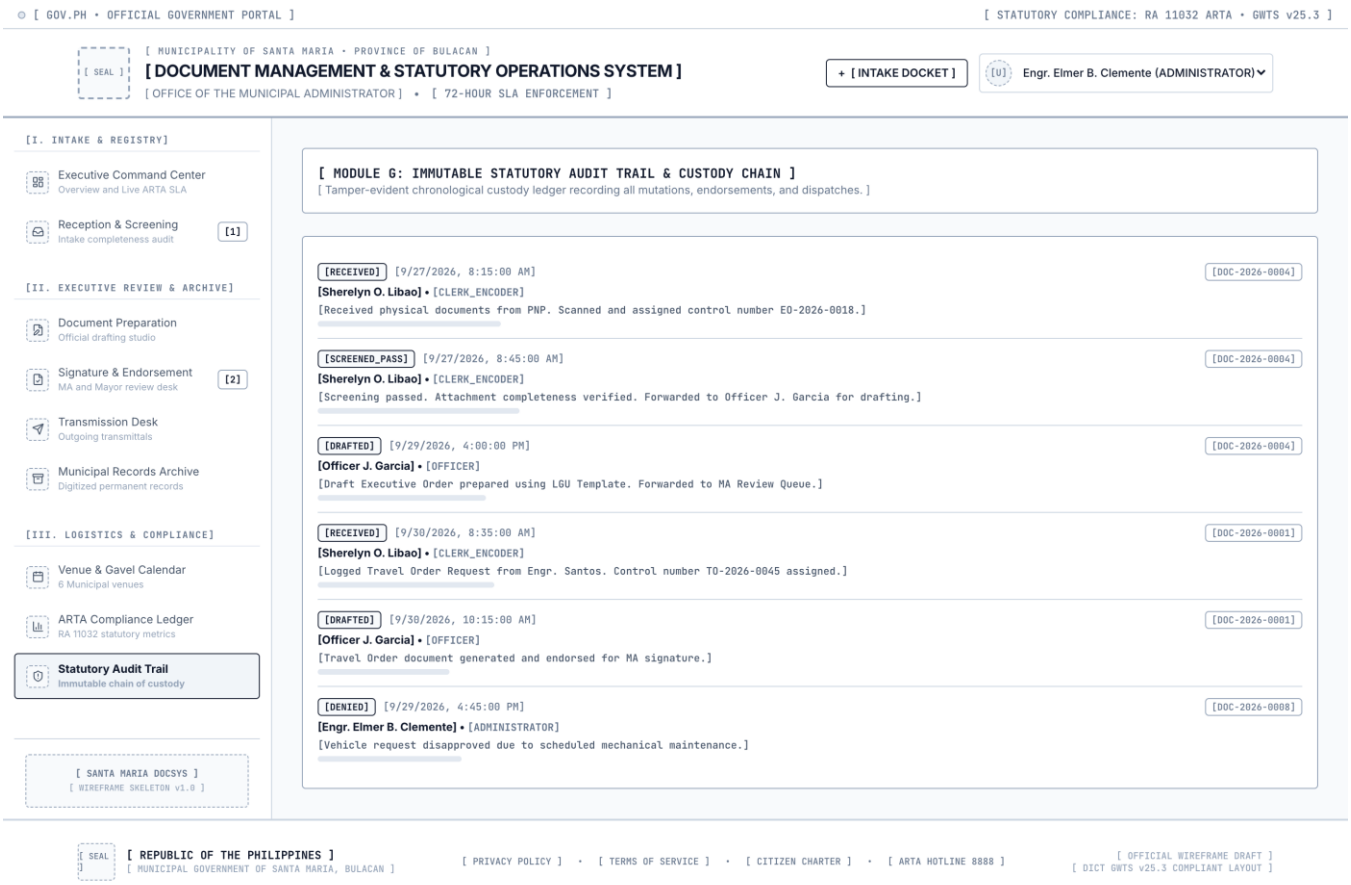

Figure 15. Statutory audit trail / administrative wireframe.

The audit view presents a chronological history of important actions so authorized users can trace who handled a record and when.

Intake Docket Modal

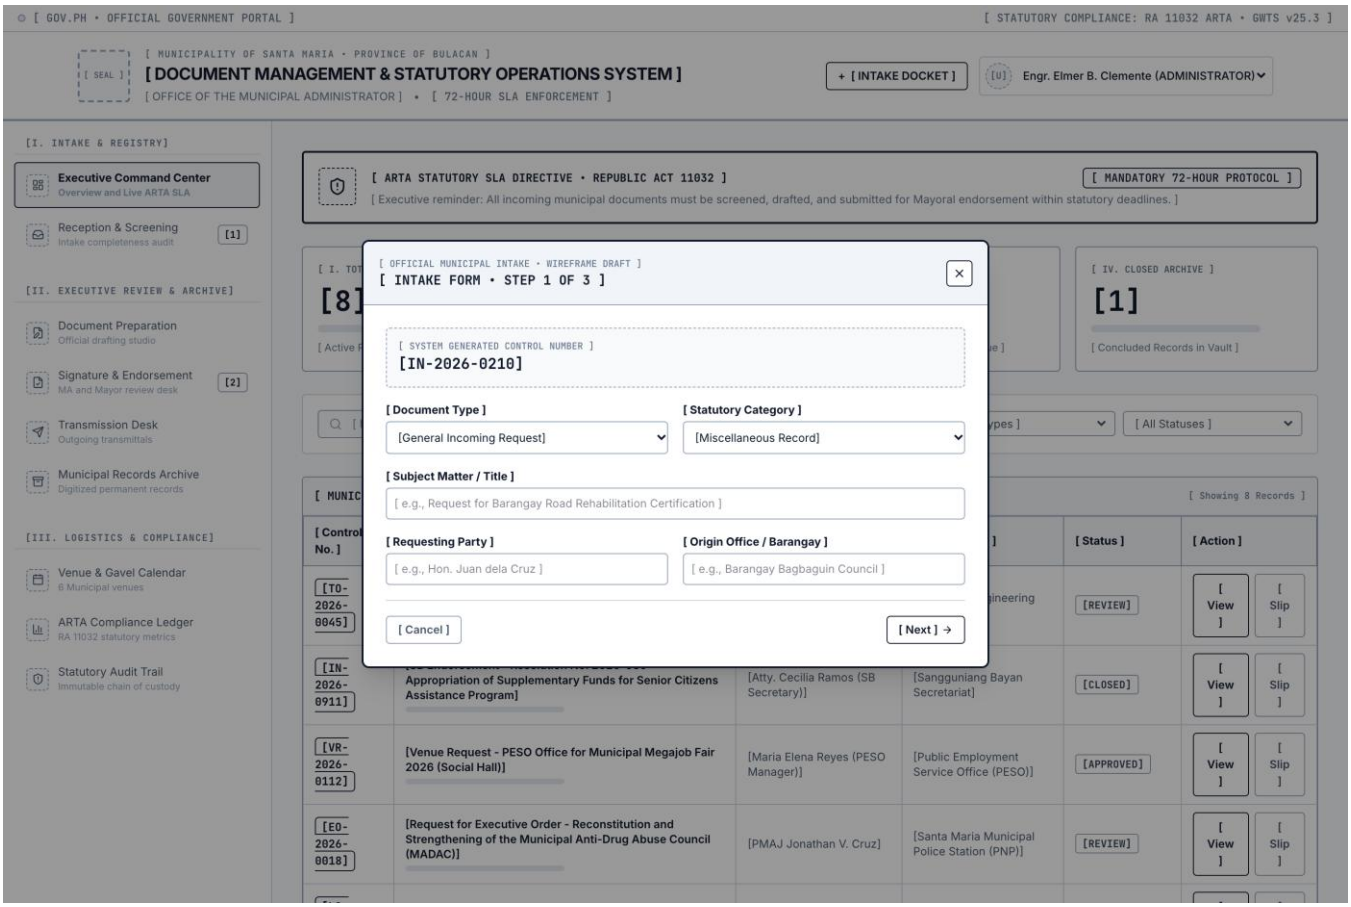

Figure 16. Intake docket modal wireframe.

The intake modal captures the core information needed to register a new request and begin the document lifecycle.

Document Dossier Modal

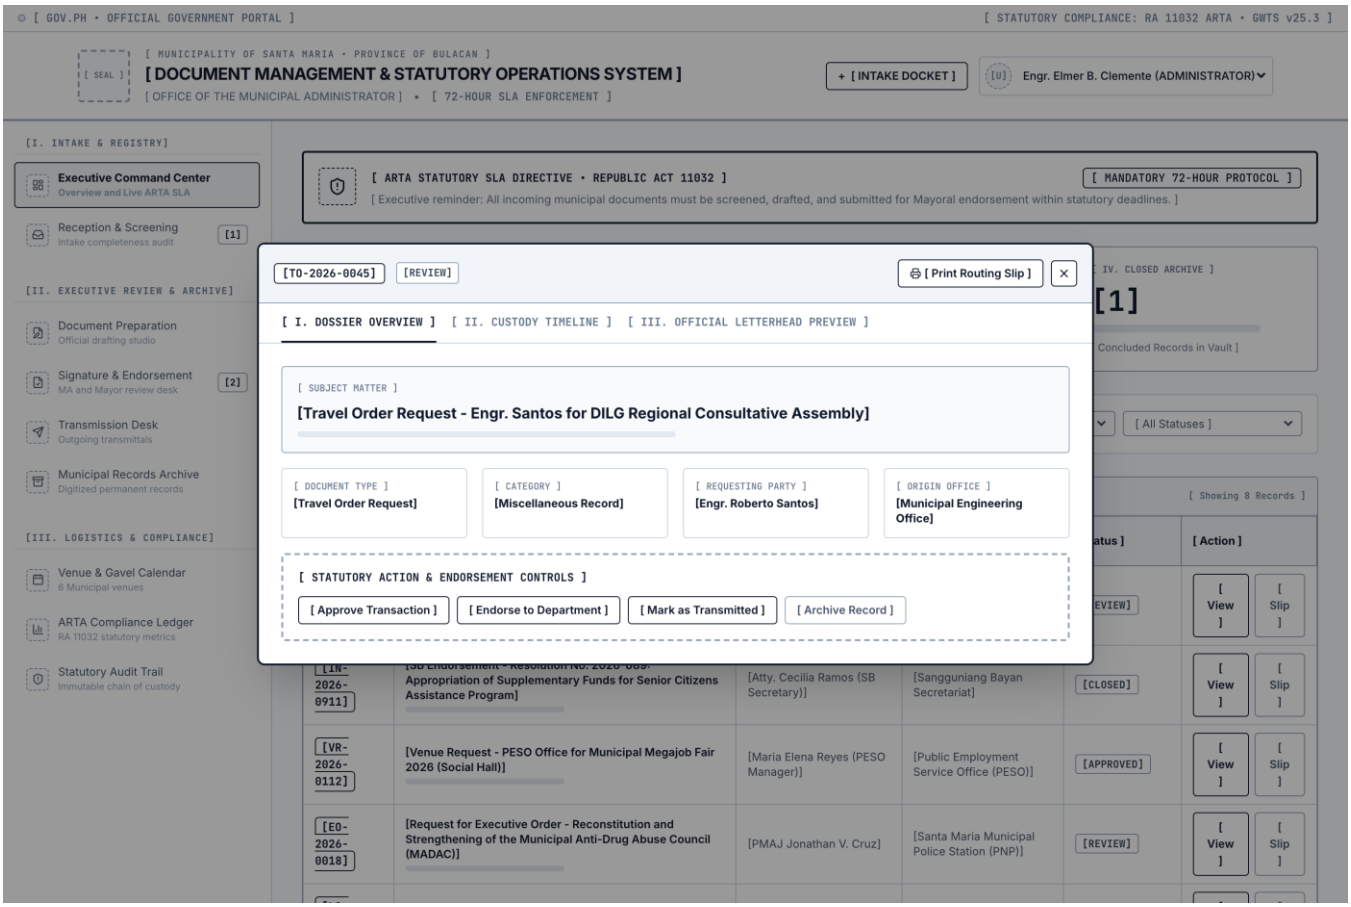

Figure 17. Document dossier modal wireframe.

The dossier consolidates record information, attachments, and workflow actions in one view for faster checking.

Routing Slip Modal

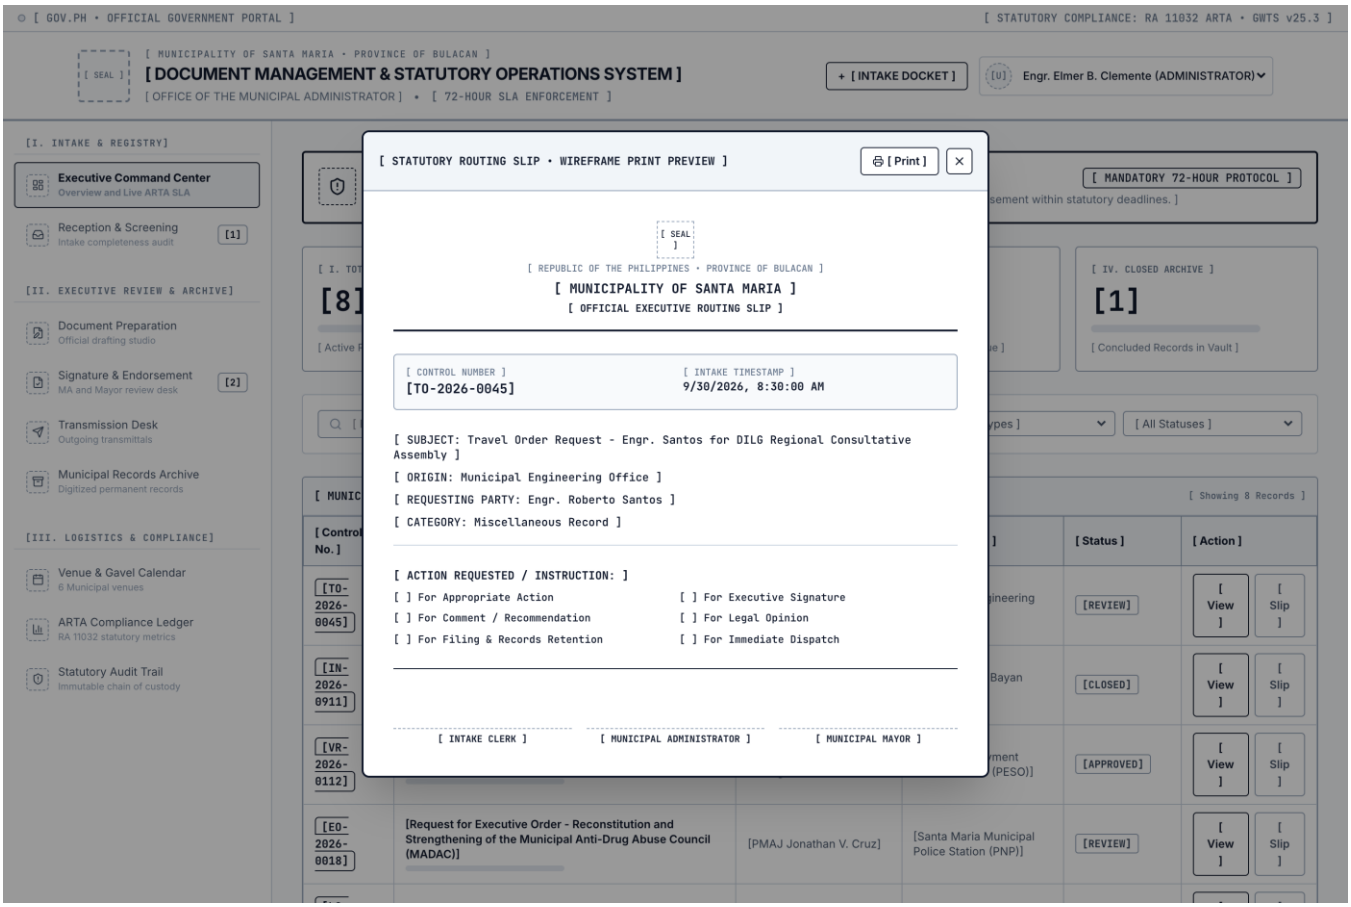

Figure 18. Routing slip modal wireframe.

The routing slip summarizes movement and action history for a document and supports traceability through the office workflow.

Proof of Letter of Intent

September 23, 2026

SUBJECT: Letter of Intent for Academic Web System Development

TO - MIS
9-22-26

HON. BARTOLOME R. RAMOS
Municipal Mayor
Municipality of Santa Maria, Bulacan

THRU:
ENGR. ELMER B. CLEMENTE
Municipal Administrator
Office of the Municipal Administrator

Dear Mayor Ramos:

We are Bachelor of Science in Computer Science students from Mapúa University, currently enrolled in Web Systems and Technologies 2. As part of our academic requirements, our group is tasked with developing a functional web-based system that addresses an actual organizational need.

Following our initial coordination with the Office of the Municipal Administrator, we understand the Office's interest in a Document System for the digitization, archiving, organization, and monitoring of official documents and records. In this regard, our group respectfully expresses its intent to design and develop the proposed system at no professional service cost to the Municipality. Should the system proceed to official deployment, the required domain registration and web hosting shall be provided or funded by the Municipality, subject to its approval and applicable procedures.

To carry out the project, we respectfully request permission to conduct requirements gathering sessions, observe relevant document-processing workflows, and interview designated personnel. All information and data obtained will be treated with appropriate confidentiality and used strictly for system development, documentation, and academic evaluation in accordance with the Municipality's policies and instructions.

Attached is our official Endorsement Letter from Mapúa University for your reference and verification. We hope this academic collaboration may contribute to the Municipality of Santa Maria's efforts toward improved document management and administrative efficiency. Thank you for your time and favorable considerations.

Respectfully yours,

MARIA ANGELIQUE D. BERNARDINO
Project Representative, BS Computer Science

Attachment: Official Endorsement Letter from Mapúa University

Proof of Agreement of Client

October 1, 2026

SUBJECT: Client Agreement for Academic Web System Development

ENGR. ELMER B. CLEMENTE
Municipal Administrator
Office of the Municipal Administrator
Municipality of Santa Maria, Bulacan

Dear Engr. Clemente:

Following our Letter of Intent dated September 23, 2026, we respectfully submit this letter to confirm the agreement between our group and the Office of the Municipal Administrator for our project titled *Cloud-Based Document Management System (DMS) for the Municipal Administrator's Office*, a requirement for Web Systems and Technologies 2 (ITS122P) at Mapúa University.

By signing below, your office agrees to serve as our client and confirms that it has reviewed and accepts the objectives and scope stated in our project proposal. Your office also allows our group to conduct requirements-gathering sessions, observe relevant document workflows, and interview designated personnel, subject to office policies.

In return, our group will develop the system at no professional service cost to the Municipality and will keep all information obtained confidential in compliance with the Data Privacy Act of 2012 (RA 10173), using it only for system development, documentation, and academic evaluation. Any domain registration and web hosting fees for official deployment shall be subject to the Municipality's approval and applicable procedures.

Thank you for your support and for accepting our project.

Respectfully yours ,

MARIA ANGELIQUE D. BERNARDINO
Project Representative, BS Computer Science

WILSON G. PONSECA
BS Computer Science Student

EDEN GRACE F. GAMUNDOY
BS Computer Science Student

LOUIS JEFFERSON V. SAMOSINO
